

Abstract

A hanger having a first hook portion extending above a central body portion has at least one arm extending laterally outward from the central body portion to a first distal end. At least one locking bar has a first end and is secured along the first arm extending adjacent the first arm to a second end. Additionally, at least one support bar can be provided having a third end and secured along the first arm extending beneath the first locking bar to a fourth end. Either or both of the second and fourth ends may extend beyond a midpoint of the hanger. A second support bar and/or a second locking bar may be provided. The locking bar deflects under the weight of the hung article to engage an article between the locking bar and a support.
